GENERALITA'

The first attempt whenever i try to build up a loop antenna is to put two wooden poles in a cross fashion. That's a base to coil the conductor. Very conventional!

I think it's derived from the fact we all are sons of the Greek philosophy, and in the bargain that the Cartesian rules have made an imprinting inside our brain.

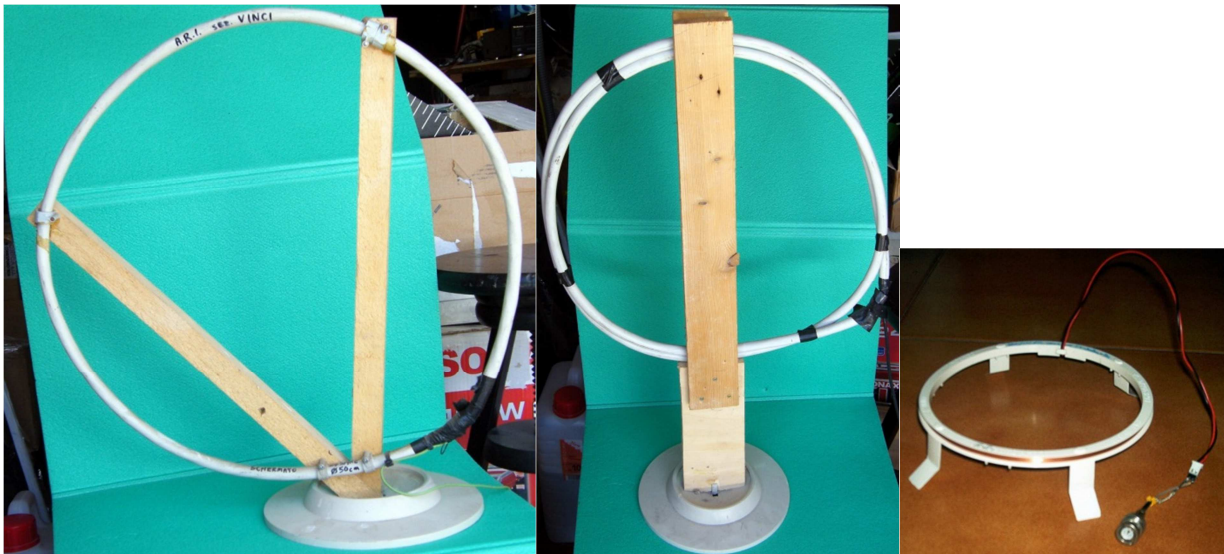

These four rows of ink are devoted only to expand the mind scheme: for instance try a new base support for small loop antennas! ☺

The following pictures are showing a V and a double flat to support small shielded multi-turn loops for long wave receiving.

Also I used a scrapped CRT video to save the plastic table base.

And finally, also from a CRT display, a focusing coil (may-be) that is interesting to use as an antenna for VLF.

Could we hope that our Xantippe clone (XYL) after seeing the new look loop authorizes it to enter in the living room? The answer to the reader!

Have a nice hobby, Alessandro Frezzotti
